ABSTRACT

Density, viscosity, surface tension and refractive index are the basic data used in various physico-chemical analyses of multicomponent fluid mixtures. Various predictive models were used for the computation of these thermodynamic and transport properties. In this work Prigogine-Flory-Patterson (PFP) model based on non-associated process was used to evaluate viscosity, excess viscosity, excess volume and surface tension and Lorentz-Lorentz relation was used to evaluate the refractive index of binary mixture of 2-propanol and 2-phenyl ethanol over the entire composition ranges from temperature 298.15-318.15K and atmospheric pressure. The computed results were compared with literature values. Excess viscosity and Excess volume were also computed to observe the extent of molecular interactions between the binary components. Lorentz-Lorentz relation deals a fair agreement with measured values while result computed from PFP model are very compatible to measured values but still modifications are required.

KEYWORDS: viscosity, surface tension, refractive index, Binary mixture, Excess function.

INTRODUCTION

In chemical industry the knowledge of transport and thermodynamic properties of liquid mixtures have a considerable importance in many technological areas such as process simulations and liquid-liquid extraction and molecular dynamics (Wang *et al.*, 2005 and Mchaweh *et al.*, 2004). Density, viscosity, surface tension and refractive index are intensive thermodynamic properties. Which do not depend upon the quantity of the substances? These transport and thermodynamic properties consist of a wide application in pharmaceutical, agrochemicals and petroleum industry. Experimental as well as theoretical study of viscosity and Excess viscosity (Awasthi *et al.*, 2022) of non-polar liquid mixture help us to understand the transport behaviour of protic and aprotic solvents. Excess volume and surface tension (Awasthi *et al.*, 2019) were evaluated at different temperatures for different alcohols. Refractive index is an intensive thermodynamic property, which does not depend on the amount of the substance. It is basically used for the identification and confirmation of the purity of substance. The prediction of refractive index of binary and multicomponent liquid mixtures (Pandey *et al.*, 1999) is essential for designing various physico-chemical calculations in terms of heat and material transfer. Refractive index depends upon frequency of the light used. Normally Yellow

Abstract:

Intermolecular free length (L_f) and excess acoustical parameters such excess isentropic compressibility (β_s^E), excess acoustical impedance (Z^E) is very important tool for the determination of internal structure and intermolecular interaction of pure liquids and liquid mixtures. Intermolecular free length (L_f), excess isentropic compressibility (β_s^E), excess acoustical impedance (Z^E) was computed for butan-2-ol and dodecane system from free length theoretical model over the entire concentration range from 298.15-318.15 K and 1atm pressure. The variation of these thermo-acoustical parameters with concentration at different temperatures helpful in understanding the molecular interactions between the different components of liquids. Non-linear variation of excess acoustical parameters confirms the molecular association in term of compressibility factor.

Keywords: Free length theory, Excess acoustical parameters, Molecular interaction, Binary liquid.

Introduction:

In recent years acoustical analysis based on ultrasonic method has become a powerful tool in the prediction of various physico-chemical and thermodynamic properties of multicomponent liquid mixture. These properties play a significant role in the construction of predictive models and development of processing and product formulation Nori *et al.* (2020) in various pharmaceutical and industrial applications. The variation of intermolecular free length and excess acoustical parameters with molar concentration helpful in the prediction of molecular interactions Nain *et al.* (2020) present in the liquids when they are mixed. The result obtained from these molecular interactions of liquids at different temperatures helpful in the preparation and the preservation of food and various pharmaceutical items such as liquid injections, syrup, tablets, and drug doses Chimankar *et al.* (2021) An exhaustive literature survey reveals that various researcher Natarajan *et al.* (2011) and Santhi *et al.* (2012) have evaluated ultrasonic velocity and excess acoustical parameters from statistical Flory *et al.* (1965) as well as other theoretical liquid state models Nomoto *et al.* (1958) and Dael *et al.* (1968) and compared with experimental values at different temperatures and predict the molecular interactions. MATHEMATICAL CORRELATION OF VISCOSITY OF ASSOCIATED POLYMERIC SOLUTION AT DIFFERENT TEMPERATURES

Naveen Awasthi

Department of Chemistry,

Corresponding author E-mail: nvn_awsthi@rediffmail.com

Abstract:

Viscosity of binary liquid mixture have been computed for 2-propanol and benzyl alcohol from McAllister three body (Mc3), four body (Mc4) based on Eyring's theory absolute reaction rate. Which correlate various thermodynamic properties of liquids using the concept of additivity and Jouyban Acree (JA) model based on least square regression analysis method at different temperatures and compared with the measured work of Ching-Ta, and Chein-Hsiun Tu. Standard deviation was the criterion of the success of results. Jouyban Acree (JA) model found to be more consistent with experimental findings.

Keywords: McAllister, Jouyban Acree, Correlation models, benzyl alcohol.

Introduction:

In past few years viscosity of pure liquids, binary and multi component liquid mixtures has become subject of deep interest for chemists in pharmaceuticals (Chimankar et al., 2021) and industrial application such as process simulation, equipment design and molecular dynamics (Mchaweh et al., 2004) and Wang et al. (2005), sometimes experimental determination of transport and other thermodynamic properties of liquid mixtures are very difficult. In that case theoretical models play a significant role in the determination of various thermodynamic and transport properties. To fulfill this requirement various researchers (Shukla et al., 2017) have formulated theoretical models to determine the theoretical viscosity in the absence of experimental results. In the continuation of previously published work (Awasthi et al., 2019) and Awasthi (2021), this book chapter deals with a comparative study of two correlation models such as McAllister multi body interaction model (McAllister (1960) and Jouyban Acree model (Jouyban et al., 2005) and (2020) at different temperatures to determine the theoretical values of viscosity and compared with the measured values (Ching-Ta et al., 2007). The main aim of this work is to compare and test the validity and applicability, these models at different temperatures for associated polymeric solutions.

Correlation models

McAllister multi body interaction model

McAllister multi body interaction model based on Eyring's theory of absolute reaction rate correlate the various thermodynamic properties of liquids using the concept of additivity. Eyring proposed an empirical equation to relate viscosity of liquid with temperature:

$$\eta = \frac{hN}{M} e^{\frac{\Delta G^*}{RT}} \quad (1)$$

Where η = Kinematic viscosity

h = Planck constant

11.1 Introduction

Throughout the life cycle of plants, they face a multitude of stress such as biotic and biotic factors. Microbial stress, usually associated with edaphic and climatic components of the environment, substantially decreased plant yields below optimum levels. The important abiotic factors hinder the agricultural productivity, almost globally are soil composition, extreme salinity, acidity, non-optical temperature, drought, pollution, rain, wind and low soil fertility (Sudhakar et al., 2011). Among them, low temperature is a major threat to food security and affecting economically important crop losses worldwide. Extreme low temperature symbolizes unprecedented ecosystems that harbor diversity of microbes called psychrophilic and cold-loving microorganisms.

A significant portion of the Earth's biosphere is safeguarded by cold and numerous microbes of particular importance in global ecology found in polar and alpine terrestrial and aquatic environments (Sudhakar et al., 2011). Approximately 20 percent of Earth's surface occupied by ice with Greenland and Antarctic ice sheets covered 10 percent of the
